

Empowering a Legal Department with Gen-AI

Get to know how a North American-based CPG company with worldwide operations implemented an AI Assistant in record time and skyrocketed productivity.

Problem

The client had been using public instances of ChatGPT to automate some of their legal department's work, but the unsecured nature of these platforms posed a confidentiality risk.

Objective

Create a branded web application that could not only tap into OpenAI's cutting-edge technology but also sync up with our client's SharePoint-based legal database.

Challenge

Build a platform controlled by designated Active Directory groups, complete with detailed logging to monitor all interactions.

Solution

Unlike **traditional builds** from scratch, which run the **risk of rapid obsolescence** due to the rapidly evolving technology landscape, our client harnessed the power of **GeneXus Enterprise AI to create a robust and adaptable foundation that could easily integrate with their existing technology stack.**

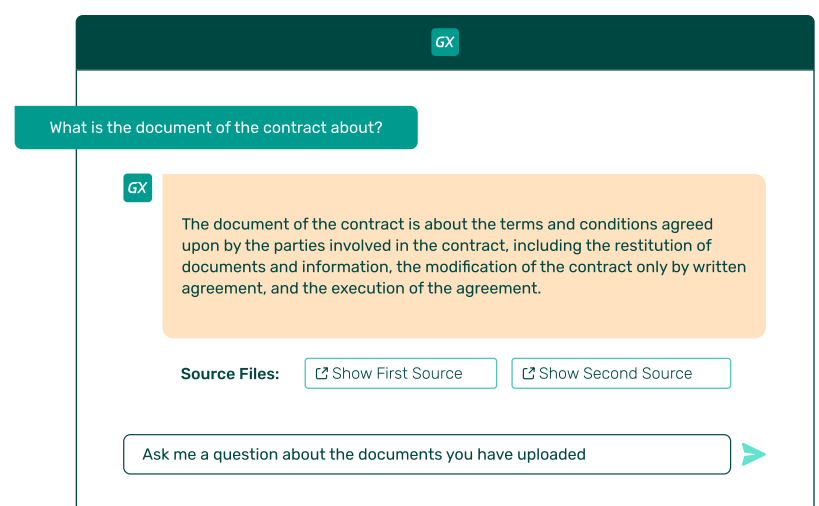

This accelerator platform **connects any company to LLMs in a monitored and cost-effective way, providing the agility to embrace the power of Generative AI.**

Embracing its power, the client could effectively supervise the costs and interactions of the solution for in-depth analysis and control and manage quotas to keep spending in check, all while staying one step ahead of the competition.

Results

The client not only **unlocked a private, branded web experience similar to ChatGPT** with access to a customized AI assistant for the legal team to chat with documents, but **enabled a broader strategy to address LLM access across the enterprise.**

Thanks to **GeneXus Enterprise AI**, users from different countries and cultures can now ask questions and receive answers in their native language, even if it is different from the language of the source document.
